Windows 8 Wireless Setup

From testing it seems that there are three different methods that can be used for connecting a Windows 8 device to the CDU WIFI networks. Which method is used is up to the tech however Cloudpath will provide the best diagnostic in tech if there are problems due to the feedback provided in the process.

This Start screen that all users are greeted with by default.

Cloudpath Method

Left click the network preferences icon in the system tray to bring up the wifi connection tool.
You will be presented with all the available networks in the area. Select an SSID to bring up the connection button.

In this case here, 'cdu-wifi-setup' has been selected. Pressing 'Connect' will connect you to the SSID. In this case once it's connected, a web browser can be opened from desktop mode and the Cloudpath process can be completed as normal.
Direct Method

Alternatively you can select any network and put the correct username and password in and it will work out the rest of the settings. Using this method it will ask you if you want to proceed as it cannot verify the certificate provided by the network. Everything should auto-configure with regards to WIFI settings. Proxy settings will still need to be set up manually if required.

Manual Method

The third method is to set up the WIFI connection manually (proxy server will need to be set up manually). Right click the network preferences icon in the system tray and select 'Open Network and Sharing Centre'.
To manually set up the WIFI connection, select the option ‘Set up a new connection or network’

From the list select the third one down titled ‘Manually connect to a wireless network’ and press ‘Next’.

Set the network name to the desired SSID and set the other settings as below and then press ‘Next’.
Press 'Change connection settings' to finalise settings.

Set the network authentication type to PEAP and then press 'Settings'.
At this stage it doesn't seem to affect connectivity if the 'Verify the server's identity' box is ticked. However if you are setting up the connection manually, it's usually easier to untick the box. When done press the 'Configure' button to get to the final screen.

Ensure to untick the checkbox here as we don't want to use the client's login credentials for the WIFI connection.
